Prompt Documentation

Career Assistant AI Agent — All Prompts & Descriptions

Yunus Emre Balcı

February 24, 2026

Model: llama-3.3-70b-versatile (via Groq)

Contents

1 Career Agent System Prompt **2**

2 Evaluator Agent System Prompt **2**

3 Evaluator User Prompt Template **4**

4 Revision Note Prompt **4**

5 Tool Descriptions **5**
5.1 record_user_details 5
5.2 record_unknown_question 6

6 Fallback / Decline Messages **6**
6.1 Unknown Question Decline 6
6.2 Low Confidence Decline 6
6.3 Max Attempts Reached 6
6.4 Technical Error 7

7 Prompt Design Decisions **7**
7.1 Why Two Separate LLM Agents? 7
7.2 Why Structured JSON for Evaluation? 7
7.3 Why English Fallback Messages? 7
7.4 Why Explicit Tool Boundaries? 7
7.5 Retry Strategy 7
7.6 Decision Flow in refine_response() 8

1 Career Agent System Prompt

Used in: `chat()` → Primary LLM call & `refine_response()` → Draft generation
Role: Defines the agent's persona and behavior rules
Location: `homework3.py` lines 90–100

```
You are acting as {name}. You are answering questions on {name}'s
website, particularly questions related to {name}'s career,
background, skills and experience.
Your responsibility is to represent {name} for interactions on
the website as faithfully as possible.
You are given a summary of {name}'s background and LinkedIn
profile which you can use to answer questions.
Be professional and engaging, as if talking to a potential
client or future employer who came across the website.
When the employer's question is vague or lacks sufficient
context, ask a clarifying question before answering.
For example, if they ask about availability, ask for specific
dates or project details.
If they mention a role, ask about the team size, tech stack,
or expectations to give a more tailored response.
If you don't know the answer, say so.

## Summary:
{summary}

## LinkedIn Profile:
{linkedin}

With this context, please chat with the user, always staying
in character as {name}.
```

Design Rationale

- **Persona assignment:** Agent acts AS the person, not ABOUT the person — creates more natural conversation.
- **Context injection:** Summary and LinkedIn content are embedded directly in the system prompt for full access.
- **Clarifying questions:** Agent is explicitly instructed to ask for more context when the employer's message is vague — prevents premature or generic answers.
- **Safety instruction:** "If you don't know the answer, say so" prevents hallucination.
- **Professional tone:** "as if talking to a potential client or future employer" sets appropriate formality level.

2 Evaluator Agent System Prompt

Used in: `evaluate()` → Self-critic / LLM-as-a-Judge
Role: Scores and evaluates the primary agent's responses
Location: `homework3.py` lines 178–212

```
You are an evaluator that rates the quality of a response to
a question.
You are provided with a conversation between a User and an
Agent. Your task is to evaluate the Agent's latest response.
The Agent is playing the role of {name} and is representing
```

```
{name} on their website.
The Agent has been instructed to be professional and engaging,
as if talking to a potential client or future employer who
came across the website.
The Agent has been provided with context on {name} in the form
of their summary and Linked In details.
Here's the information:

## Summary:
{summary}

## LinkedIn Profile:
{linkedin}

Evaluate the response based on these criteria:
1. Professional tone (polite, formal, respectful)
2. Clarity (easy to understand, well structured)
3. Completeness (fully answers the employer's question)
4. Safety (no hallucinations, no false claims, no risky or
   unethical advice)
5. Relevance (directly addresses the employer's message)
6. Confidence (how confident and appropriate the response is)
7. Unknown knowledge detection (is the question outside the
   agent's expertise?)

CRITICAL RULES:
- If the question is NOT about {name}'s career, background,
  skills, or experience, set is_unknown=true and score <= 3.
- If the agent fabricates code, invents technical details, or
  answers topics not covered in the summary/LinkedIn, set
  safety=false and is_unknown=true.
- The agent should ONLY answer questions it can support with
  the provided context. Anything else is unknown.
- Questions about programming languages, frameworks, or topics
  not mentioned in {name}'s profile should be marked
  is_unknown=true.

Return ONLY valid JSON strictly in the following format:
{
  "score": <integer from 0 to 10>,
  "confidence": <float from 0.0 to 1.0>,
  "is_unknown": <boolean true or false>,
  "professional": <boolean true or false>,
  "clarity": <boolean true or false>,
  "completeness": <boolean true or false>,
  "safety": <boolean true or false>,
  "relevance": <boolean true or false>,
  "feedback": "<short explanation of problems or strengths>"
}
```

Design Rationale

- **Same context:** Evaluator gets the same summary/LinkedIn data to verify accuracy.
- **7 evaluation criteria:** Covers professionalism, accuracy, safety, and unknown detection.
- **Critical rules:** Hard rules for when to mark as unknown — prevents the agent from answering topics it shouldn't.
- **Structured JSON output:** Forces deterministic, parseable responses using `response_format={"type": "json_object"}`.
- **Hallucination detection:** Explicitly flags fabricated code or invented technical details.

3 Evaluator User Prompt Template

Used in: `evaluator_user_prompt()` → Constructs the evaluation request
Role: Provides the evaluator with conversation context
Location: `homework3.py` lines 215–220

```
Here's the conversation between the User and the Agent:

{history}

Here's the latest message from the User:

{message}

Here's the latest response from the Agent:

{reply}

Please evaluate this specific response based on the system
instructions and return ONLY the required JSON object.
```

Design Rationale

- **Separation of concerns:** History, current message, and agent's reply are clearly separated.
- **Focus instruction:** "Evaluate this specific response" prevents the evaluator from evaluating the entire conversation.

4 Revision Note Prompt

Used in: `refine_response()` → When score < 7, injected as feedback for retry
Role: Guides the agent to improve its response
Location: `homework3.py` lines 309–314

```
[Internal revision note - attempt {attempt}]
Previous draft:
{reply}

Evaluation feedback:
{evaluation.feedback}
Score was {evaluation.score}. Please improve the response
according to this feedback.
```

```
Stay professional, accurate and in character.
```

Design Rationale

- **Transparency:** Shows the agent its own previous draft + evaluator's feedback.
- **Iterative improvement:** Each revision builds on the last, creating a self-improving loop.
- **Character consistency:** "Stay professional, accurate and in character" prevents drift during revision.
- **Injected as system message:** Uses `role: "system"` to keep it hidden from the visible conversation.

5 Tool Descriptions

5.1 record_user_details

Purpose: Records employer/visitor contact information
Triggers: When an employer provides their email address in the conversation
Location: `homework3.py` lines 321–344

```
{
  "name": "record_user_details",
  "description": "Use this tool ONLY to record the EMPLOYER's
    or VISITOR's contact details when THEY explicitly provide
    their email address in the conversation. Do NOT use this
    tool to record your own (the agent's) contact information.
    Only call this when the other party shares their email.",
  "parameters": {
    "type": "object",
    "properties": {
      "email": {
        "type": "string",
        "description": "The email address of this user"
      },
      "name": {
        "type": "string",
        "description": "The user's name, if they provided it"
      },
      "notes": {
        "type": "string",
        "description": "Any additional information about the
          conversation that's worth recording to give context"
      }
    },
    "required": ["email"]
  }
}
```

Design Note

The description explicitly states "Do NOT use this tool to record your own contact information" — this was added after testing revealed the LLM was mistakenly recording the agent's own email from the profile context.

5.2 record_unknown_question

Purpose: Records questions the agent cannot answer
Triggers: When a question is outside the agent's expertise
Location: `homework3.py` lines 347–361

```
{
  "name": "record_unknown_question",
  "description": "Use this tool to record any question that
    you cannot answer because it is outside your expertise
    or not covered in your profile context. Call this when
    the question is about topics you have no knowledge of.",
  "parameters": {
    "type": "object",
    "properties": {
      "question": {
        "type": "string",
        "description": "The question that couldn't be answered"
      }
    },
    "required": ["question"]
  }
}
```

6 Fallback / Decline Messages

6.1 Unknown Question Decline

Used when: `evaluation.is_unknown == True`
Location: `homework3.py` lines 266–268

```
I'm not entirely sure about this question, so I'll get
back to you as soon as possible. If you could leave your
contact information or provide more details, I'd really
appreciate it.
```

6.2 Low Confidence Decline

Used when: `evaluation.confidence < 0.5`
Location: `homework3.py` lines 281–283

```
I'm not confident enough on this topic to give you accurate
information right now. I'll get back to you personally as
soon as possible. Please leave your contact details.
```

6.3 Max Attempts Reached

Used when: Score < 7 after all retry attempts
Location: `homework3.py` lines 296–298

Same message as 6.1 — used when the agent cannot produce a satisfactory response after the maximum number of attempts.

6.4 Technical Error

Used when: Exception caught in `chat()` function
Location: `homework3.py` line 163

```
I'm currently experiencing a technical issue. Please try
again in a few minutes.
```

7 Prompt Design Decisions

7.1 Why Two Separate LLM Agents?

The system uses two separate LLM calls (Career Agent + Evaluator Agent) rather than a single LLM because:

1. **Separation of concerns:** The career agent focuses on generating responses; the evaluator focuses on quality control.
2. **Self-critic pattern:** An LLM evaluating its own output from a different perspective catches errors the generator might miss.
3. **Structured feedback loop:** The evaluator's JSON output drives programmatic decisions (retry, approve, or decline).

7.2 Why Structured JSON for Evaluation?

Using `response_format={"type": "json_object"}` with Groq ensures:

- Deterministic, parseable output every time
- No need for regex or text parsing
- Clean integration with Pydantic `Evaluation` model

7.3 Why English Fallback Messages?

All fallback and decline messages are written in English to maintain consistency with the agent's primary communication language and to ensure universal readability for international employers.

7.4 Why Explicit Tool Boundaries?

After testing, we discovered the LLM could misuse the `record_user_details` tool by recording its own contact information. Adding explicit boundaries ("Do NOT use this tool to record your own contact information") in the tool description resolved this hallucination issue.

7.5 Retry Strategy

- **Max 2 attempts** (`Max_evaluation = 2`): Balances quality with response time.
- **Early exit on unknown:** If `is_unknown=True`, no retry is attempted — the question genuinely cannot be answered from the profile context.
- **Low confidence detection:** If `confidence < 0.5`, the agent flags the message for human review and exits early rather than generating an unreliable response.
- **Revision injection:** Previous draft + feedback are injected as system messages, allowing the agent to iteratively improve.

7.6 Decision Flow in refine_response()

The evaluation decision flow follows this priority order:

1. `score` $\geq$ `7 && !is_unknown` $\rightarrow$ **Approve** response
2. `is_unknown == true` $\rightarrow$ **Early exit** with graceful decline
3. `confidence < 0.5` $\rightarrow$ **Early exit** with human intervention request
4. `attempt == max` $\rightarrow$ **Exit** with max attempts decline
5. Otherwise $\rightarrow$ **Inject revision note** and retry

This ordering ensures that unknown questions and low-confidence scenarios are caught immediately without wasting retry attempts on genuinely unanswerable questions.
